

## Modification of the PA0160 in order to give 24V at the IN1 to IN8

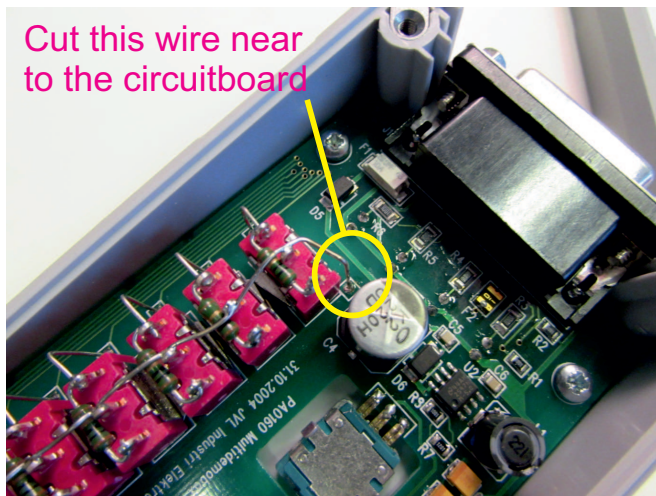

V1.00 - 20150113

The standard PA0160 only produces 12V at the IN1 to IN8 signals. This is however not enough to activate the inputs at the MIS23x, MIS34x, MIS43x and the modules MAC00-B41 and B42. Below is shown how to change the IN1 to IN8 signals from 12V to 24V which will enable the box to operate with the products mentioned above.

Unscrew the 4 screws placed in each corner of the box and lift of the rear cover.

Cut this wire near to the circuitboard

Resolder it to the pin of the diode as shown
